ABSTRACT (10PT)

(Write abstract in one paragraph)

Background : Provide a concise overview of the current state of knowledge related to the research problem. Briefly explain the context and significance of the issue based on recent studies or technological developments.

Objective : Clearly state the purpose of the study. Define what the research aimed to discover, analyze, or demonstrate within the scope of the investigation.

Methods : Describe the approach and methodology employed to address the research objective. Specify the type of study conducted, such as a quantitative analysis, randomized controlled trial, qualitative survey, systematic literature review, or double-blind experiment.

Results : Present the main findings of the study with precision. Include specific data, observed outcomes, or analytical results relevant to the research objective. Avoid vague or generalized statements.

Conclusion : Summarize the interpretation of the results and indicate whether the research objective was achieved. Discuss the implications of the findings, any encountered limitations, and suggestions for future research directions.

The abstract must be written in a structured format and consist of 150 to a maximum of 300 words

1. Introduction (*Heading 1*) (bold, 11 pt)

The introduction section of an Informatics research article serves as the foundational narrative that explains the context, relevance, and purpose of the study. It should clearly articulate the current technological landscape and identify specific issues, challenges, or limitations that motivate the research. Authors are expected to incorporate recent and relevant literature (published within the last 5–10 years) to justify the need for investigation and to emphasize the significance of the problem being addressed. This section typically includes (1) a detailed description of the background and real-world phenomena, (2) a critical gap analysis that highlights what has not been sufficiently explored in previous studies, (3) the objective(s) of the research framed as a response to the identified gap, and (4) a brief outline of the method or approach taken. All components must be written in a concise, academic tone and arranged logically to lead the reader toward a clear understanding of the research's contribution. The length of the introduction is generally limited to 500–800 words using Times New Roman font, 10-point size, with 1.15 or 1.5 line spacing, and justified alignment. This structured format ensures uniformity and clarity across Informatics journals and facilitates peer review, indexing, and publication processes.

2. Method

The methodology section in an Informatics research article presents a detailed explanation of the systematic steps undertaken to achieve the research objectives. This section aims to provide sufficient information to allow other researchers to replicate or validate the study. In general, the structure of the methodology includes the following key components: (1) the type and research approach used (e.g., quantitative, qualitative, experimental, R&D, or case study), (2) a description of the system or object being studied, (3) data sources and data collection techniques (such as observation, interviews, documentation, surveys, or secondary data), (4) tools, software, or frameworks employed in the design and testing of the system, (5) procedures or research implementation steps (such as system development stages, algorithms, or models used), and (6) data analysis techniques (whether statistical, algorithmic, performance evaluation, or validity testing). The methodology should be written in a clear, descriptive, and logical manner, and may include diagrams where appropriate, to ensure the reader fully understands the research process. The text should be formatted using Times New Roman font, 10 pt, with 1.15 line spacing, justified alignment, and should ideally range between 400 and 700 words, depending on the complexity of the study.

2.1 Type and Approach of Research

This subsection explains the research type and approach employed in the study, such as quantitative, qualitative, experimental, research and development (R&D), case study, or a mixed-method approach. The justification for choosing this approach should be clearly stated in relation to the research objectives.

2.2 Object and Scope of Research

Describes the system, application, device, or phenomenon that serves as the main focus of the research. If applicable, it also includes the research domain (e.g., education, e-commerce, healthcare) or specific boundaries of the study.

2.3 Data Collection Techniques

Explains how the data were obtained—through observation, interviews, surveys, documentation, or secondary sources. If relevant, this section should also describe the population and sampling technique used.

2.4 Tools and Materials Used

Describes the tools, frameworks, software, programming languages, hardware, or digital libraries used during the study, including any platforms used for testing or simulation.

2.5 Research Procedures or Stages

Details the step-by-step procedures taken during the research. If a development model is used (e.g., SDLC, waterfall, agile, MDLC), each phase should be described. Diagrams or flowcharts may also be included.

2.6 Data Analysis Techniques

Explains how the collected data were analyzed to answer the research questions or test hypotheses. This could involve statistical analysis (e.g., t-test, ANOVA), algorithm evaluation (accuracy, precision, recall), model validation, or qualitative interpretation.

3. Results and Discussion

After the text edit has been completed, the paper is ready for the template. Duplicate the template file by using the Save As command, and use the naming convention prescribed by your conference for the name of your paper. In this newly created file, highlight all of the contents and import your prepared text file. You are now ready to style your paper; use the scroll down window on the left of the MS Word Formatting toolbar.

3.1 Presentation of Research Results

This subsection presents the outcome of the research activities. Results should be delivered in a clear, factual, and objective manner, without subjective interpretation. Visual aids such as tables, graphs, screenshots, and performance charts should be used to reinforce the data presented. All figures and tables must be numbered, captioned, and referenced in the text.

What to include:

- Performance metrics (accuracy, precision, recall, F1-score, etc.)
- Comparison tables between models or systems
- Screenshots of the developed system (if applicable)

- User testing results (surveys, usability scores)
- Descriptive statistics (mean, standard deviation, etc.)

3.2 Analysis of Findings

This section interprets the results in the context of the research questions or hypotheses. The analysis must go beyond describing what the results are — it should explain why those results occur, how they relate to existing studies, and what insights they provide. It is crucial to compare with previous literature, highlight unexpected patterns, and provide theoretical reasoning.

What to include:

- Explanation of high or low performance
- Reasons for model behavior
- Patterns, trends, or anomalies observed
- Comparison with prior studies (cite them)
- Connection to research objectives and questions

Table 1. Table Styles

Table Head	Table Column Head		
	Table column subhead	***Subhead***	***Subhead***
copy	More table copy		

We suggest that you use a text box to insert a graphic (which is ideally a 300 dpi resolution TIFF or EPS file with all fonts embedded) because this method is somewhat more stable than directly inserting a picture.

To have non-visible rules on your frame, use the MSWord "Format" pull-down menu, select Text Box > Colors and Lines to choose No Fill and No Line.

Fig. 1. Example of a figure caption. *(figure caption)*

Figure Labels: Use 10 point Times New Roman for Figure labels. Use words rather than symbols or abbreviations when writing Figure axis labels to avoid confusing the reader. As an example, write the quantity "Magnetization," or "Magnetization, M," not just "M." If including units in the label, present them within parentheses. Do not label axes only with units. In the example, write "Magnetization (A/m)" or "Magnetization (A (m(1)," not just "A/m." Do not label axes with a ratio of quantities and units. For example, write "Temperature (K)," not "Temperature/K."

3.3 Implications of the Results

This part highlights the significance and contribution of the research. It discusses how the findings can be applied in practice, contribute to the development of theory or models, or enhance understanding of a specific problem. Consider academic, industrial, and societal relevance.

What to include:

- Practical applications of the system
- Theoretical contributions
- Benefits to target users or stakeholders
- Future use cases or potential expansion

3.4 Limitations of the Study

Identifies the limitations or constraints encountered during the study. This shows transparency and provides context for future researchers to improve or continue the study. This subsection discusses the limitations and constraints faced during the research process. Acknowledging limitations demonstrates academic integrity and helps set boundaries for the conclusions drawn. It also gives direction for future studies to improve upon or explore related issues.

What to include:

- Dataset limitations (size, diversity, quality)
- System limitations (platform dependency, feature completeness)
- Methodological constraints
- Environmental or contextual factors
- Suggestions for overcoming these in future work

4. Conclusion

The conclusion section summarizes the key findings, reflects on the research objectives, and highlights the significance of the study. It should be written concisely, without introducing new data or analysis. A good conclusion in Informatics research restates the problem, outlines how the research addressed it, and proposes future directions or practical implementations.

Acknowledgment *(HEADING 5)*

The preferred spelling of the word "acknowledgment" in America is without an "e" after the "g." Avoid the stilted expression "one of us (R. B. G.) thanks ...". Instead, try "R. B. G. thanks...". Put sponsor acknowledgments in the unnumbered footnote on the first page.

Declarations *(HEADING 5)*

Author contribution. The contribution or credit of the author must be stated in this section.
Funding statement. The unding agency should be written in full, followed by the grant number in square brackets and year.
Conflict of interest. The authors declare no conflict of interest.
Additional information. No additional information is available for this paper.

Data and Software Availability Statements *(HEADING 5)*

Data and Software availability statements provide a statement about where data and software supporting the results reported in a published article can be found, including hyperlinks to publicly archived datasets and software analyzed and generated during the study/experiments.

References *(HEADING 5)*

The reference section must include relevant, up-to-date, and credible sources, primarily drawn from scientific journals, conference proceedings, academic books, or official research reports. In Informatics and Computer Science, references are typically formatted according to the IEEE (Institute of Electrical and Electronics Engineers) style.

- A minimum of 20 references is required.
- **At least one citation must refer to a relevant article published in *Media Jurnal Informatika*.**
- At least 80% should come from reputable journals or international conference proceedings.
- At least 70% of the references should be from the last 5–10 years (published between 2015–2025).
- Avoid citing blogs, Wikipedia, or unpublished student reports unless essential and verifiable.
- Capitalize only the first word of an article or paper title (except for proper nouns or element symbols).
- For translated articles, give the English version first, followed by the original language version in brackets.
- Do **not use "et al."** unless there are more than six authors (even then, list the first six and add "et al." only if allowed by the journal).
- Articles accepted but not yet published: label as "**in press**".

- Unpublished work: label as "**unpublished**".
